## **Introduction**

At present, the topics of ecology, sustainable development and conservation of natural resources and ecosystems for future generations are becoming vitally important in the world. In Northeast Asia the transboundary position of extensive natural areas make environmental problems even more specific and pressing. Being in different countries, parts of transboundary areas remain closely related to each other by many natural processes like water flows, atmospheric transfer, sea currents, animal migration, etc. That is why many changes in the environment, including air and water pollution, are transboundary in nature.

## **Objectives**

The main objectives of the upcoming conference is to discuss cross-border issues of sustainable management, use and conservation of natural resources, to synthesize international experience and the latest achievements in the field of environment conservation and sustainable natural resource use through the further development of international scientific cooperation in Northeast Asia.

## **Topics and Agenda**

The following topics are proposed for discussion.

- **Current status and sustainable use of transboundary water, land, wetland and biological resources (1);**

- **Environmental problems and adaptive management of natural resources under industrial and agricultural development of transboundary areas (2);**
- **Environment conservation strategies in the context of sustainable economic development of Northeast Asian countries (3).**

**The conference will include plenary sessions, workshops and short post-conference tours, which will be specified in the 2<sup>nd</sup> announcement.**

**Working languages: English and Russian**
